STEP 8

POINTS TO NOTE:

1. Before connecting the power, please check whether the connection between the two sides of the bed and the tail light connector is correct. If not, please reconnect it. Otherwise, short circuit fault (flashing or not lit) will occur. Therefore, it must not be connected wrongly.
2. Inductive probes should be installed in the middle of both bed beams, (The sensor is tilted 45 degrees outwards.)
3. After power up, all lights enter self-test mode: All the lights flash for one second and then turn off. Then the lights will turn on automatically when the user enters the sensor range. The lights will turn off automatically after 30 seconds after the user leaves.
