

Guidelines for Shaping Your Cedar Tree

Guidelines for Shaping Your Cedar Tree

Dear Customers:

✔ Proper Tree Shaping Instructions:

When shaping the tree, we recommend the following: Use one hand to hold the base of the branch and the other hand to gently bend the top of the branch down to form a 45° angle with the trunk. (Note: The branch angle should not exceed 65°.)

○ The properly shaped tree has an even structure, with branches and leaves distributed in a balanced way, giving the appearance of natural growth. Ensure the trunk is stable, the branches are layered, and the foliage is full and evenly spread.

✘ Incorrect Tree Shaping Instructions:

The incorrect tree shape has an uneven structure, with branches and leaves that are too sparse and an unstable trunk. Avoid overlapping branches or irregular growth to maintain an attractive overall appearance.
