## Installation steps

(All screw holes have been reserved)

**Suggest using an electric screwdriver to assist with installation.**

1. Connect a back panel and side panel with screws, and then place the floor properly

2. Install the middle partition, raise the bottom of the partition to facilitate the pulling of the bottom plate

3. Install side panels with metal fences to connect and secure them to the back panel

4. Install the front panel and secure it to the two side panels and the middle partition

5. Install both sides of the roof (There are wooden blocks to fix the position of the roof, no need to use screws)

6. Install the lace and ridge around the roof, which need to be fixed with screws
