Installation steps

(All screw holes have been reserved)

Suggest using an electric screwdriver to assist with installation.

1. Connect a back panel and side panel with screws, and then place the floor properly

2. After placing the floor (the floor does not need to be connected), install another side panel

3. Connect the two side panels and the front panel (with a door) with screws

4. Place the outer floor and install the fences which needs to be connected to both the floor and the panel

5. Install the fence with doors and finally place all the roofs (Wooden blocks to fix the position of the roof)

6. Install the lace and ridge around the roof, which need to be fixed with screws
