Choose your seat height

For a 35–37" kitchen counter, choose the 26" seat height.

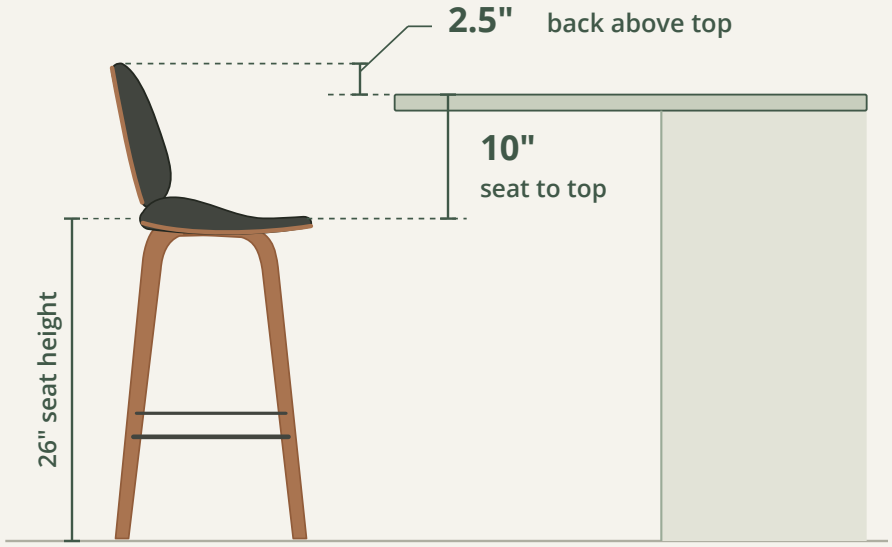

26" COUNTER STOOL

38.5" overall height

SIDE VIEW

At a 36" countertop

Example shown with a 36" finished counter height.

Measure your own counter

01 Measure to the top

Measure from the floor straight up to the finished counter surface. Compare that height with the 35–37" range above.

02 Check knee space

Measure from the floor to the lowest drawer, apron, or underside above your knees. Subtract 26" to find the open space above the seat.

Considering the 30" bar stool?

Use 30" as the seat height when checking knee space at a taller bar. Confirm the other measurements on the listing for that height.

How many stools will fit?

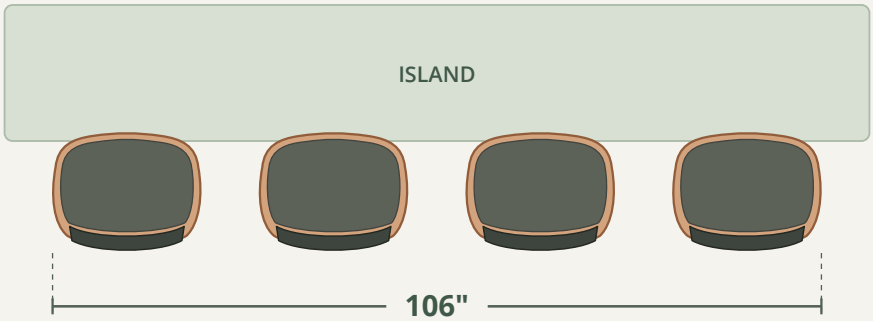

For the 26" stool, measure the usable island edge between legs or side panels.

20.5" overall stool width | **8"** example gap between stools

SET OF FOUR

Four in a row

Allow 106" along one edge, plus extra room at both ends.

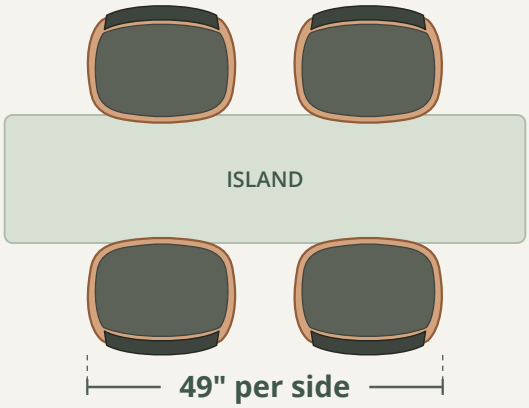

4 × 20.5" stools + 3 × 8" gaps

SET OF FOUR

Two per side

Allow 49" on each edge, plus room at both ends. Choose opposite sides with an overhang and knee space on both.

2 × 20.5" stools + 1 × 8" gap

Buying a pair? Use the same 49" span for two stools along one edge.

Try the layout with painter's tape

Mark a 20.5" wide × 16.3" deep footprint for each 26" stool. Leave room at the ends, then test pulling out a stool and walking behind someone seated.
