STRUCTURES WALL SYSTEM

BASE FRAME CONNECTION

Engineered base frames come in five different sizes to accommodate wall setups from 31 to 131 inches wide.

- 1 Base is put in place and leveled using built-in levelers.
- 2 A tall or short cabinet is then set onto the base using the cleat and channel for placement.
- 3 Pre-installed threaded inserts are used to securely attach the cabinet

INTERLOCKING CABINETS

Each cabinet piece is designed to fit either directly onto the base frame or onto another cabinet.

Cabinets are available as single or double units.

Because both ends (top and bottom) of each cabinet include the same connectors and cleat/channel, single door units can be set up to open left or right.

Door style cabinets ship with both glass and wood door panels for easy customization.

FINISHING CROWNS

Like the base, the finishing crown frame is designed to fit in place with the help of the interlocking cleat and channel guide.

Pre-installed threaded inserts are used to securely attach the crown to the cabinet top.
