

Chandelier Installation Safety Warning

1. **Professional Installation Required:** Always have a licensed electrician or a qualified professional install the chandelier. Improper installation can result in electrical hazards, fire risks, or injury.
2. **Power Off:** Before starting any installation or maintenance, ensure the power is completely turned off at the circuit breaker to avoid electrical shock.
3. **Weight Limit:** Ensure that the mounting surface is capable of supporting the chandelier's weight. If unsure, consult a structural engineer or a professional installer.
4. **Proper Wiring:** Verify that all wiring connections are secure and meet local electrical codes. Use only appropriate and certified electrical components to avoid short circuits or malfunctions.
5. **Secure Hanging:** Make sure that the chandelier is properly secured with appropriate fasteners and that all support points are stable.
6. **Inspection:** Periodically inspect the chandelier to ensure it remains securely mounted and that wiring is intact. If you notice any loose parts or damaged wiring, turn off the power and seek professional assistance.
7. **Use of Ladder:** When installing the chandelier, use a sturdy, properly positioned ladder to avoid accidents or falls.
8. **Avoid Overloading:** Do not exceed the recommended wattage for light bulbs. Overloading can cause overheating and increase the risk of fire.
9. **Keep Away from Water:** Do not install the chandelier in areas exposed to excessive moisture or water, unless it is specifically designed for such environments.
