

How to Use Smart Brackets

Up-Down Adjustment

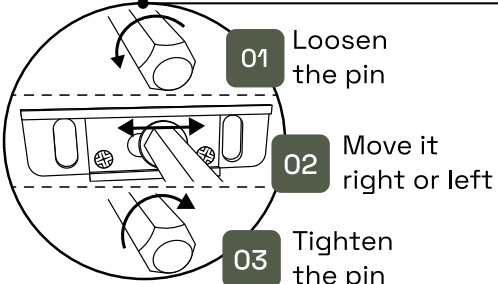

01 Loosen the screws

02 Move it up and down

03 Tighten the screws

Right-Left Adjustment

01 Loosen the pin

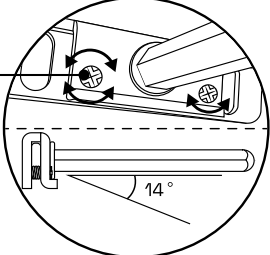

02 Move it right or left

03 Tighten the pin

What to do if the shelf is Tilted?

Check the brackets for proper installation and alignment. If adjustments are needed, use the tilt adjustment screw to level the shelf. Most brackets allow up to 14° of tilt adjustment.

Tighten all screws and pins securely after adjustments. Use a spirit level for accuracy.

*** Shelf Tilt Adjustment**

Up-Down Adjustment

Loosen both screws slightly using a screwdriver — just enough to let the bracket move up and down. Do not unscrew them completely.

Slide the bracket to your preferred height. Use a level to make sure it's straight.

Tighten both screws firmly to secure the bracket in place.

Right-Left Adjustment

Loosen the round metal pin using pliers, turning it counterclockwise just enough to let it slide left and right.

Move the pin to the position you need. Tighten it back with pliers, turning it clockwise to lock it in place

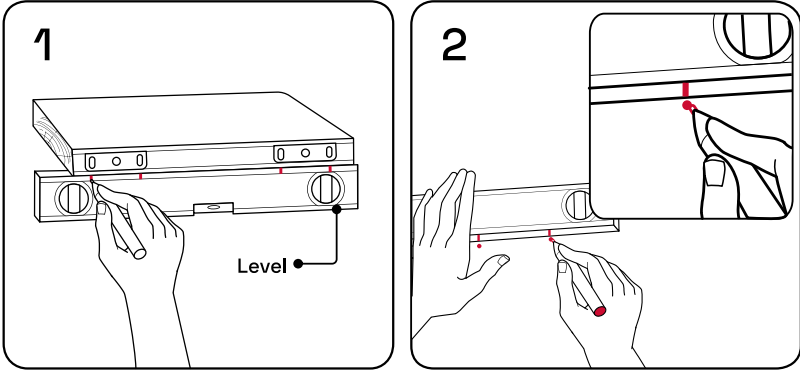

Begin Installation

Tools You’ll Need

- Power Drill (or screwdriver)
- Level
- Pencil or Marker

Marking the Wall

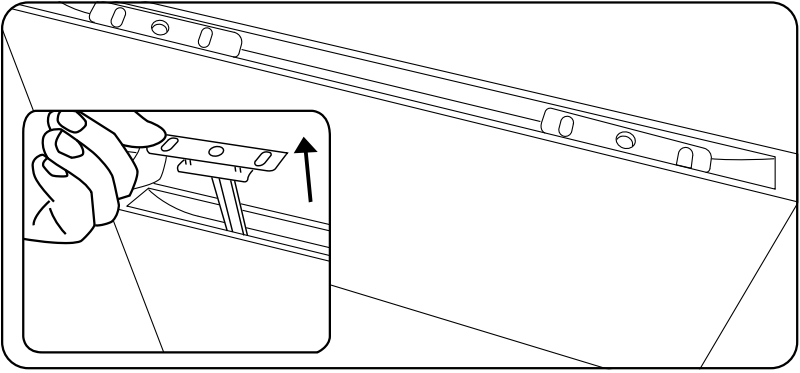

- 1 Make marks opposite the holes in the brackets
- 2 Transfer the marks to the wall

Ready to go

Pull the brackets out of the shelves back slots.

If it feels tight, apply a little more force.

Step 01 Into Stud

If you're sure there are no studs, skip to Step 02.

If you're unsure, start with this step.

Drive the self-tapping screw through the bracket and directly into the wall.

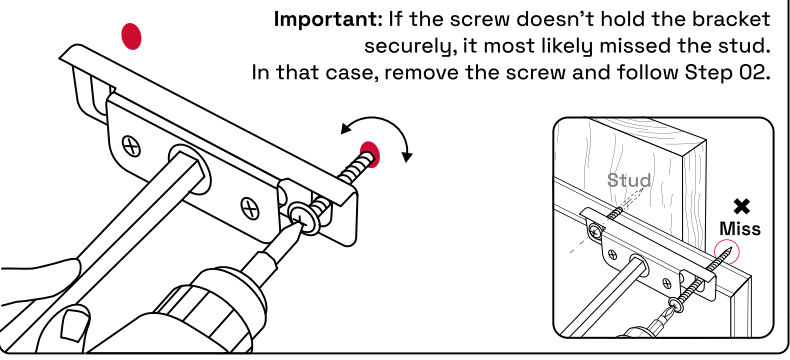

✓ Correct position

✗ Incorrect position

Bracket Position

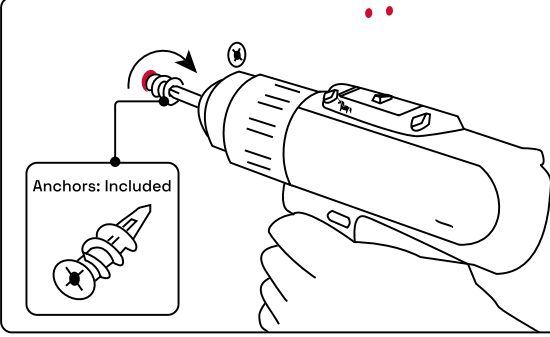

Important: If the screw doesn't hold the bracket securely, it most likely missed the stud. In that case, remove the screw and follow Step 02.

Insert the screw through the bracket and drive it directly into the marked location on the drywall. Pre-drilling is not necessary for these screws.

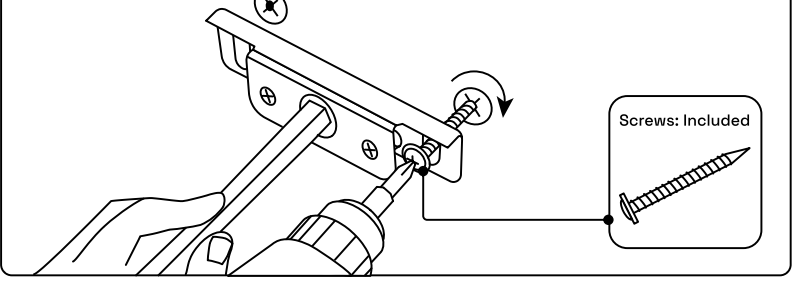

Step 02 Without Stud

Insert the anchor into the marked location and slowly screw it into the wall using a drill or screwdriver. No pre-drilling is needed.

Anchors: Included

Screwing in the Anchor (side view)

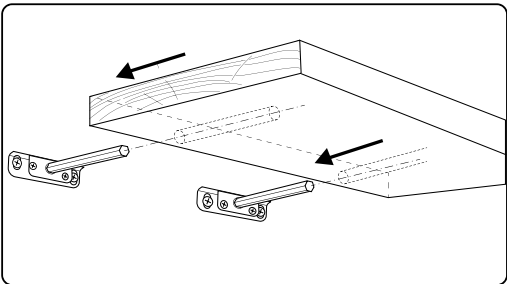

Screws: Included

Align the brackets with the installed anchors. Secure them by driving the provided screws through the bracket into the anchors.

Step 03 Shelf Insert

Slide shelves onto the securely mounted brackets

If it doesn't fit properly, refer to the "How to Use Smart Brackets" section for adjustment instructions — or feel free to reach out for support.

What to do if the shelf is tilted?

Check that the brackets are installed correctly. If adjustment is needed, use the tilt screw to level the shelf. The brackets allow for up to 14° of tilt correction.

Turn the screws located under the metal pin on each bracket using a screwdriver:

- Clockwise — the shelf tilts upward
- Counterclockwise — the shelf tilts downward

Adjust both brackets evenly to maintain balance.

Crafting Stories For Your Space

Made from solid pine, our pieces offer a perfect blend of quality and rustic charm, bringing character to any room.

By supporting timeless design, you help preserve traditional craftsmanship — the kind that gives every piece its soul.
