Maintenance

For best results, clear dust, limescale, food residues, etc. away from the exterior surfaces of this water sink after use. Do not use abrasive cleaners or caustic chemicals.

Check the parts of this water sink for any signs of looseness, wear, or damage periodically. Tighten, repair, or replace any problematic parts before further use.

YITAHOME stainless steel sink is manufactured from high-quality stainless steel that naturally resists rusting. However, improper use or lack of maintenance can lead to issues such as "floating rust" and "mold spots".

1. During kitchen renovation, residues like welding debris, paint, cement, and oil might stay on the sink surface. Failing to clean these away promptly can cause rusting and molding.
2. In newly renovated houses, dust with acidic or alkaline minerals can cause “floating rust” when landing on and moistening the sink surface.
3. Steel items like kitchen knives, scissors, and bottle openers can cause "floating rust", molding, or discoloration when left on the sink surface for extended periods.

★ Prevention and Treatment

1. Prior to installation, drain any long-standing water inside the pipes. After installation, thoroughly rinse the sink. Following each use, the sink should be thoroughly cleaned so that there are no debris or water stains.
2. If the sink experiences "floating rust" or "mold spots", clean them with toothpaste, cleansers, or stainless steel cleaners, and wipe down with a cloth.

★ Avoid using steel wool to scrub the sink, or use cutting items directly on the sink. This can damage the surface and lead to rusting, making it unattractive. Do not use corrosive liquids to clean the sink.
