Stainless Steel Brackets—Installation Instructions

One left and right main frame, one storage rack, one towel bar, one reinforcement bar, screws and other installation accessories.

First take out the main frame and storage rack. Take the long screw and a washer, line up the screw holes, and tighten.

Take out the reinforcement rod and insert it into the hole.

Take out the small screw plus the washer, and tighten the reinforcement rod.

Both sides of the bracket reinforcement rod are tightened with small screws and washers.

Take out the towel bar, there is a hole in the front of the shelf, just insert it.

Take out the small screw and washer. It needs to be tightened on both the left and right side of the bracket.

Take out the balance screws and tighten them at the bottom of the four corners of the shelf. If it is unbalanced, you can adjust the height.

Stainless Steel Brackets—Installation Instructions

Then put the black decorative cover, where there are screws on the cover.

For the four supporting corners above the shelf, tighten a balance screw at each corner to the lowest position.

If the sink basin is unbalanced after it is placed on the shelf, you can adjust the height of the balance screw to ensure that the sink basin is installed stably.

Finally, if you feel that the shelf is not stable enough, you can take long screws and reinforce it on the wall.

Stainless steel shelves installed.

Some styles have a front baffle, snap the front baffle onto the front of the shelf, align the screw holes and tighten the screws.
