

Installation Instructions

This fish tank is an integrated unit and does not require assembly. Just put the delivered equipment in it

First, collect all the parts that need to be installed so that the installation process can proceed smoothly.

Fold this trachea in half to create two sections. Insert one end into the blue air tube, and the other end into the artificial hill.

Then, following the previous step, attach the blue air tube of the trachea to the artificial rock and place it in the fish tank. Insert the other two ends of the air tube into the holes in the fish tank (you can use a water plant clip for assistance)

After taking it out from the other end, insert the water pipe into the water pump. Once it is properly inserted, place it aside and wait for the next step.

I found these in the accessories and put them all into the middle compartment of the fish tank.

Take out a piece of the sponge, fold it in half, and put it into the separate compartment of the fish tank.

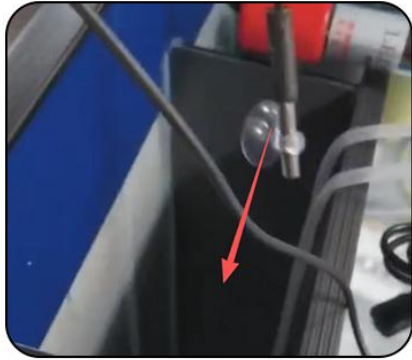

Take out the water pump and the blue tube. Insert the wide end of the tube into the water pump and then place it in another compartment of the fish tank.

Place it in another compartment of the fish tank and insert the white pipe at the top of the tank into the other end.

Remove the lamp tube. There are two suction cups attached to the top of the lamp tube (note that the lamp beads are facing downwards). Then fix it on the top of the fish tank.

There is a metal probe on the display screen. Simply insert it into the compartment for easy measurement of water temperature.

Just insert the power adapter directly into the voltage socket.

Finally, all that's needed is to install the glass cover properly, and then place the complimentary flowers and plants inside according to your own preferences.
