

Bamboo Post and Rail Fence Installation Instructions

Posts and rails are best to be installed paralleled to the sidewalk: the eye is unconsciously led down the length of the post and rail fence, accentuating this impressive span of road frontage. Its length is accentuated while, at the same time, the fence and the plantings fill up the space, giving the eye a rest from what otherwise would be an open expanse of a lawn.

Bamboo post and rail fences combines the design of both Eastern and Western landscape architecture. Rather than log wood, we use mature bamboo to construct our bamboo post and rail fences. They come in different sizes and can ordered in sections depending how much you need. Easy to install and customized to meet your requirements.

Wood posts are recommended to support the fence. Black twine could be taken off for a different look as a second option.
