

HOW TO SECURE YOUR TABLE TOP WORK SURFACE

For extra support you can secure your table top work surface to your cabinet bodies. This will prevent warping and movement while working.

TOOLS NEEDED (screws not included)

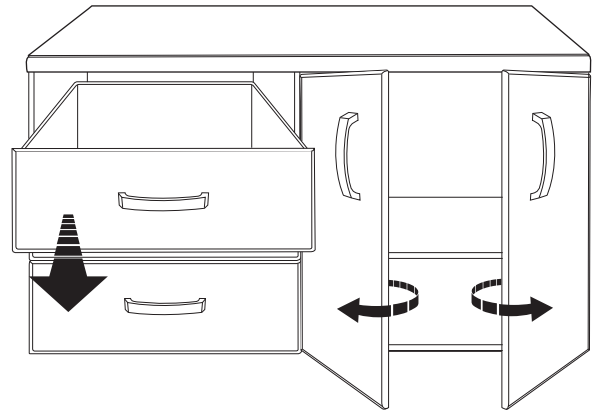

4 Flat Head # 8 x 1 inch
Phillips Wood Screw

Electric Screwdriver

Step 1.

Remove the top drawer and open up cabinet doors.

Step 2.

With the work surface in place on top of cabinets, begin by measuring and marking **2 inches in from the side** of the cabinet, and **1 inch in from the front** of the cabinet. Use an electric screwdriver to screw on top of the mark with Phillips wood screws, screwing through the cabinet into the work surface. Use 2 screws per cabinet. **Optional:** You can secure the back of the cabinets with 2 more screws if you choose. In most cases it is not necessary.
