Enhancements

Cartridge Hold Down Nut	Nut has been redesigned with higher grip area to ease removal. This is important should service be required.
Spout Movement	Two acetal bearings placed on each end of the inner body allow the spout body to move smoothly with a minimum amount of friction. These bearings also serve to reduce the amount of pressure on the o-ring seals.
Double O-Rings	Four heavy-duty o-rings are placed on the inner body of the spout to seal it during movement from side to side (double the normal amount). These o-rings are designed with a minimum amount of squeeze, due to the acetal bearings, and will allow the o-rings to seal for an extended life.
Ceramic Cartridge	New long-life cartridge crafted from the most durable European ceramics.
Mounting System	All flexible stainless steel hoses are housed within the large mounting nipple. A massive locking nut eases installation and holds the faucet firmly to the sink.
Side Spray	The original side spray has been replaced with an improved version from our Beluga series.
Diverter for Side Spray	A new diverter has been designed and proven to be a dripless performer, minimizing vibration, chatter and noise.
